Sources: Stringer Asset Management and Morningstar. Performance data quoted represents past performance and is for illustrative purposes only. Past performance is not a guarantee of future results. The total returns presented are gross of fees. Advisory fees and any other expenses incurred in the management of the account will reduce actual returns. Returns include the reinvestment of income. The indices represented do not bear transaction costs or management fees, and cannot be actually bought or sold. To the extent a shareholder pays sales charges, the performance shown would be less. All indices are unmanaged and investors can not invest directly in an index. For index definitions, see the Index Definitions section at the end of this document. Please refer to the important disclosures found at the end of this document.
Investors tend to fall short of achieving the opportunities and returns presented by the financial markets. The impact of investment errors caused by the constant market noise, media-hype and uncertainty of real world economic and market events may not be realized for years. We have dedicated our careers to refining our investment processes to avoid those emotional pitfalls and help you realize your financial goals.

“Manage the risks and the returns take care of themselves.”

» The Cash Indicator
Despite recent market volatility, we think that the current business cycle will extend for at least another year, if not longer. Equity markets tend to peak approximately six months before the end of a business cycle.

The Federal Reserve (Fed) will continue raising short-term interest rates over the coming quarters. At this point, we think the economy can absorb these interest rate increases. Leading economic indicators suggest that the U.S. will continue to advance better than the other developed economies.

We think that shifting markets and volatility will create new investment opportunities.

The earnings yield suggests that U.S. equities can compound at 5-7% annualized total return going forward, stock market volatility aside. We think it makes sense to maintain an equity tilt.

Our indicators suggest little chance of a recession in the next 12 months. This should lead to higher stock prices over the next year, though it may be a bumpy ride.

» SPDR MSCI Emerging Markets StrategicFactors (QEMM)
With the recent selloff in emerging market equities, we made a purchase that we think can benefit from attractive relative valuations. This position brings our emerging market exposure closer to benchmark weighting, but still underweight since we expect continued volatility in this area. That said, we think that the potential upside is compelling despite acute risks associated with certain individual countries.

» Alps Sector Dividend Dogs (SDOG)
We expect muted equity price returns going forward, so we think that dividend income will be an important factor in generating total returns. While many dividend-focused strategies concentrate on only a few sectors, we recently purchased an ETF that offers diversified exposure to high quality companies that pay significant dividends. By starting with the universe of the companies within the S&P 500 Index, the investment process begins with a pool of high quality companies. Then, the ETF equally weights their stocks across S&P 500 Index to offer a level of diversification and stability.

Inflation Should Stay Near Current Levels

» Market-based inflation indicators, such as 10-year TIPS spreads, are not breaking higher in our opinion.

» As the chart above indicates, market-based inflation expectations as represented 10-year Treasury Inflation Protection Securities (TIPS) spreads have plateaued at a rate below their business cycle peak in 2014.

» As a result, we think that more inflationary pressure is unlikely in this environment.
Leading economic indicators suggest that the U.S. will continue to advance better than the other developed economies.

We think that shifting markets and volatility will create new investment opportunities.

As long as fundamentals remain sound, we recommend staying the course and taking advantage of market volatility and new investment opportunities.
Two of our favorite fundamental indicators are weekly jobless claims, or layoffs, and jobs openings.

Layoffs are near record lows while the number of job openings is at a record high.

Combined, we think these measures paint a picture of a very healthy labor market.

As more jobs are created and wages slowly push higher, consumer spending should increase, which creates a virtuous cycle.
While the U.S. economy will likely continue providing opportunities for corporate revenue and earnings growth that can support higher stock prices, we expect the rate of growth and the rate of stock price appreciation to slow.

Earnings yield has historically provided a good indication of stock market returns going forward and currently suggests that U.S. equities can compound at a 5-7% annualized total return going forward, stock market volatility aside.

INVESTMENT IMPLICATIONS

» Our indicators suggest little chance of a recession in the next 12 months, so we expect further economic growth along with higher corporate revenues and earnings, but at a significantly slower pace than has been the case recently. This should lead to higher stock prices over the next year, though it may be a bumpy ride.

» We expect the positive effects from tax cuts and increased government spending to fade just as interest rate hikes from the Fed begin to bite. Slower economic growth should keep a lid on long-term interest rates.

» Slower growth and range-bound or falling long-term interest rates should benefit defensive sectors and longer-duration fixed income holdings, such as taxable munis and floating rate funds as well.
» As previously mentioned, we recently added a dividend-oriented domestic equity position that we think can add stability to our strategies.

» In addition, we moved back into emerging markets equities. Though we are still underweight emerging market exposure compared to the global equity market and have room to add, we thought that it made sense to start building positions in emerging markets at these levels.

» Developed markets like Japan also look interesting and we are increasingly watching Europe.

The Cash Indicator

» The Cash Indicator (CI) has slipped well below its historical average. This suggests that there is plenty of liquidity in the global markets and volatility has tamed.

» Still, we expect the CI to rise, along with equity market volatility, as economic growth slows. Without signs of recession or a huge spike in the CI, market dips should be a buying opportunity.

Stringer Asset Management, LLC is a registered investment adviser that generally provides services through model portfolios on a sub-advisory business. The firm primarily allocates clients’ investment management assets among exchange-traded funds (“ETFs”) and secondarily among mutual funds. Stringer Asset Management claims compliance with the Global Investment Performance Standards (“GIPS®”). A fully compliant GIPS presentation along with a complete list and description of all composites is available at www.stringeram.com or by calling 901-800-2956.

This material provided is for informational purpose only. Investments discussed may not be suitable for all investors. No part of the authors’ compensation was, is, or will be directly or indirectly related to the specific views contained in this report. Information provided is obtained from sources deemed to be reliable; but is not represented as complete, and its accuracy is not guaranteed. The information and opinions given are subject to change at any time, based on market and other conditions, and are not recommendations of or solicitations to buy or sell any security. Opinions and forecasts expressed herein may not actually occur.

ETFs are offered by prospectus. Investors should carefully consider a fund’s investment objectives, risks and charges before investing. The prospectus contains this and other information. Your financial advisor can provide prospectuses which you should read carefully before investing. Any discussion of the individual securities that comprise a portfolio or strategy is provided for informational purposes only and should not be deemed a recommendation to buy or sell any security. The securities identified and described may not represent all of the securities purchased, sold or recommended for client accounts. The reader should not assume that an investment in the securities identified was or will be profitable.

The benchmark indices are referred to for comparative purposes only and are not necessarily intended to parallel the risk or investment approach of the accounts included in the Composites. These indices were chosen to give perspective on the risk management philosophy and asset allocation portfolio management process with respect to the performance of the Composites.

Performance:

Past performance is not indicative of future results. The investment return and principal value of an investment will fluctuate so that an investor’s shares when redeemed may be worth more or less than their original cost. Current performance may be higher or lower than the performance data quoted. Advisory fees and any other expenses incurred in the management of the account will reduce actual returns. The performance of any individual portfolio may not be considered comparable to the Composite performance.
Disclosures

Performance (continued):

The Growth Composite includes all portfolios that mainly invest in equity and alternative ETFs selected from the global investment opportunity set. The Growth Composite has risk characteristics similar to that of the broad equity market and include but are not limited to equity risk, international investing risk and capitalization risk. The total returns presented are gross and net of fees. Advisory fees and any other expenses incurred in the management of the account will reduce actual returns. The benchmark is the MSCI ACWI Index rebalanced quarterly as of January 1, 2016. The benchmark is market-cap weighted and is composed of several country-specific indices. Sources of foreign exchange rates may be different between the composite and the benchmark; however, there have not been material differences to date. Prior to January 1, 2016, the benchmark was the MSCI World Index rebalanced quarterly. Prior to January 1, 2015, the blended benchmark was 70% Russell 3000 Index and 30% MSCI ACWI xUS Index rebalanced quarterly. In both cases, the benchmark was retroactively changed to more closely follow our investment strategy. The index represented does not bear transaction costs or management fees, and cannot be actually bought or sold. It is not possible to invest directly in an index. For index definitions, see the Index Definitions section at the end of this document. The U.S. Dollar is the currency used to express performance. Material use of leverage, derivatives and short positions are not used in this composite.

The Moderate Growth Composite includes all portfolios that mainly invest the majority of their assets in equity exchange-traded funds but also includes fixed income and alternative ETFs selected from the global investment opportunity set. The Moderate Growth Composite has risk characteristics lower than that of the broad equity market and include but are not limited to equity risk, international investing risk and credit risk. The total returns presented are gross and net of fees. Advisory fees and any other expenses incurred in the management of the account will reduce actual returns. The benchmark is a blend of 65% MSCI ACWI Index and 35% Bloomberg Barclays U.S. Aggregate Bond Index rebalanced quarterly as of January 1, 2016. The benchmark is market-cap weighted and is composed of several country-specific indices. Sources of foreign exchange rates may be different between the composite and the benchmark; however, there have not been material differences to date. Prior to January 1, 2016, the blended benchmark was 65% MSCI World Index and 35% Barclays U.S. Aggregate Bond Index rebalanced quarterly. Prior to January 1, 2015, the blended benchmark was 45% Russell 3000 Index, 20% MSCI ACWI xUS Index and 35% Barclays U.S. Aggregate Bond Index rebalanced quarterly. In both cases, the benchmark was retroactively changed to more closely follow our investment strategy. The index represented does not bear transaction costs or management fees, and cannot be actually bought or sold. It is not possible to invest directly in an index. For index definitions, see the Index Definitions section at the end of this document. The U.S. Dollar is the currency used to express performance. Material use of leverage, derivatives and short positions are not used in this composite.

Disclosures

Index Definitions:

*Bloomberg Barclays U.S. Aggregate Bond Index* – This Index provides a measure of the U.S. investment grade bond market, which includes investment grade U.S. Government bonds, investment grade corporate bonds, mortgage pass-through securities and asset-backed securities that are publicly offered for sale in the United States. The securities in the Index must have at least 1 year remaining to maturity. In addition, the securities must be denominated in US dollars and must be fixed rate, nonconvertible and taxable.

*MSCI ACWI (Net) Index* – This Index is a free float-adjusted market capitalization weighted index that is designed to measure the equity market performance of developed and emerging markets. The MSCI ACWI Index consists of 23 developed and 23 emerging market country indexes. Net total return includes the reinvestment of dividends after the deduction of withholding taxes, using a tax rate applicable to non-resident institutional investors who do not benefit from double taxation treaties.

*S&P 500 Index* – This Index is a capitalization-weighted index of 500 stocks. The Index is designed to measure performance of a broad domestic economy through changes in the aggregate market value of 500 stocks representing all major industries.

Statistical Definitions:

*Standard Deviation* – A statistical measure of volatility, standard deviation is often used as an indicator of the ‘risk’ associated with a return series. Standard deviation of return measures the average deviations of a return series from its mean. A large standard deviation implies that there have been large swings in the return series of the manager.

*Alpha* – Alpha is a measure of risk (beta)-adjusted return. Alpha measures the difference between a portfolio’s actual returns and what it might be expected to deliver based on its level of risk. In an ideal sense, higher risk should equate to higher return. A positive alpha means the fund has beaten expectations. A negative alpha means that the fund has failed to match performance given its level of risk. If two managers have the same return, but one has a lower beta, that manager would have a higher alpha.

*Beta* – This represents the systematic risk of a portfolio and measures its sensitivity to a benchmark. A portfolio with a beta of one is considered to be as risky as the benchmark and would therefore provide expected returns equal to those of the market benchmark during both up and down periods. A portfolio with a beta of two would move approximately twice as much as the benchmark.

*Yield* – Portfolio and blended benchmark yield is calculated using a harmonic weighted average of the net dividends per share during the past 12 months for each holding as of the date identified at their respective target weighting.
Disclosures

Principal Risks:

**General Risk of Loss:** All investments in securities include a risk of loss of principal (invested amount) and any profits that have not been realized (i.e., the securities were not sold to “lock in” the profit). Stock markets and bond markets fluctuate substantially over time, and markets have experienced increased volatility in recent years. As recent global and domestic economic events have indicated, performance of any investment is not guaranteed. As a result, there is a risk of loss of the assets we manage. Stringer Asset Management cannot guarantee any level of performance or that account assets will not be lost. Stringer Asset Management does not represent, warrant, or imply that the services or methods of analysis used can or will predict future results, successfully identify market tops or bottoms, or insulate clients from major losses due to market corrections or crashes. No guarantees are offered that clients’ goals or objectives will be achieved. Furthermore, no promises or assumptions can be made that the advisory services offered by Stringer Asset Management will provide a better return than other investment strategies. Varied fluctuations in the price of investments are a normal characteristic of securities markets due to a variety of influences. Stringer Asset Management’s managed account programs should be considered a long-term investment; as long-term performance and performance consistency are among our key objectives. **Risks Related to Mutual Funds and ETPs:** An investment in a mutual fund or an ETP, which includes ETFs and ETNs, involves risk, including the loss of principal. Mutual fund and ETP shareholders are subject to the risks stemming from the individual issuers of the fund’s underlying portfolio securities. Such shareholders are also liable for taxes on any fund-level capital gains, as mutual funds are required by law to distribute capital gains in the event they sell securities for a profit that cannot be offset by a corresponding loss. Shares of mutual funds are generally distributed and redeemed on an ongoing basis by the fund itself or a broker acting on its behalf. The trading price at which a share is transacted is equal to a fund’s stated daily per share net asset value (“NAV”), plus any shareholders’ fees (e.g., sales loads, purchase fees, redemption fees). The per share NAV of a mutual fund is calculated at the end of each business day, although the actual NAV fluctuates with intraday changes to the market value of the fund’s holdings. The trading prices of a mutual fund’s shares may differ significantly from the NAV during periods of market volatility, which may, among other factors, lead to the mutual fund’s shares trading at a premium or discount to NAV. Shares of ETFs are listed on securities exchanges and transacted at negotiated prices in the secondary market. Generally, ETF shares trade at or near their most recent NAV, which is generally calculated at least once daily for indexed-based ETFs and more frequently for actively managed ETFs. However, certain inefficiencies may cause the shares to trade at a premium or discount to their pro rata NAV. There is also no guarantee that an active secondary market for such shares will develop or continue to exist. Generally, an ETF only redeems shares when aggregated as creation units (usually 50,000 shares or more). Therefore, if a liquid secondary market ceases to exist for shares of a particular ETF, a shareholder may have no way to dispose of such shares. **Risk Related to Liquidity:** Stringer Asset Management’s strategies may include investments subject to liquidity risk, which exists when particular investments are difficult to purchase or sell. Such securities may become illiquid under adverse market or economic conditions and/or due to specific adverse changes in the condition of a particular issuer. If our strategies invest in illiquid securities or securities that become illiquid, returns may be reduced because our strategies may be unable to sell the illiquid securities at an advantageous time or price.
Disclosures

Principal Risks (continued):

*Risks Related to Management Through Similarly Managed Accounts:* For certain clients, Stringer Asset Management manages strategies by allocating assets among various securities on a discretionary basis using one or more of its proprietary investment strategies (collectively referred to as “investment strategy”). In so doing, Stringer Asset Management buys, sells, exchanges and/or transfers securities based upon the investment strategy. Stringer Asset Management’s management using the investment strategy complies with the requirements of Rule 3a-4 of the Investment Company Act of 1940, as amended. Rule 3a-4 provides similarly managed accounts, such as the investment strategy, with a safe harbor from the definition of an investment company. The investment strategy may involve an above-average portfolio turnover that could negatively impact upon the net after-tax gain experienced by an individual client. Securities in the investment strategy are usually exchanged and/or transferred without regard to a client’s individual tax ramifications. Certain investment opportunities that become available to Stringer Asset Management’s clients may be limited. For example, various mutual funds or insurance companies may limit the ability of Stringer Asset Management to buy, sell, exchange or transfer securities consistent with its investment strategy.

*Risks Related to Domestic Equities:* Stringer Asset Management’s strategies that utilize equity securities are subject to the risk that stock prices may fall over short or extended periods of time. Individual companies may report poor results or be negatively affected by industry and/or economic trends and developments. The prices of securities issued by such companies may suffer a decline in response. These factors contribute to price volatility, which is the principal risk of investing in equity securities.

*Risks Related to Company Size:* Stringer Asset Management’s strategies may invest in small-capitalization and mid-capitalization stocks, which are often more volatile and less liquid than investments in larger companies. The frequency and volume of trading in securities of smaller and mid-size companies may be substantially less than is typical of larger companies. Therefore, the securities of smaller and mid-size companies may be subject to greater and more abrupt price fluctuations. In addition, smaller and mid-size companies may lack the management experience, financial resources and product diversification of larger companies, making them more susceptible to market pressures and business failure.

*Risks Related to International Equities:* Stringer Asset Management’s strategies that invest in foreign companies pose additional risks since political and economic events unique to a country or region may affect those markets and their issuers. In addition to such general international risks, the strategies may also be exposed to currency fluctuation risks and emerging markets risks as described further below. Changes in the value of foreign currencies compared to the U.S. dollar may affect (positively or negatively) the value of the strategy’s investments. Such currency movements may occur separately from, and/or in response to, events that do not otherwise affect the value of the security in the issuer’s home country. Also, the value of the strategy may be influenced by currency exchange control regulations. The currencies of emerging market countries may experience significant declines against the U.S. dollar, and devaluation may occur subsequent to investments in these currencies by the strategy. Foreign investments, especially investments in emerging markets, can be riskier and more volatile than investments in the U.S. and are considered speculative and subject to heightened risks in addition to the general risks of investing in non-U.S. securities. Finally, inflation and rapid fluctuations in inflation rates have had, and may continue to have, negative effects on the economies and securities markets of certain emerging market countries.
Principal Risks (continued):

**Risks Related to Currency Hedging:** Stringer Asset Management strategies that invest in non-U.S. securities may employ a currency hedging strategy. Because of this, these strategies may have lower returns than an equivalent non-currency hedged investment when the component currencies are rising relative to the U.S. dollar. As such, contracts to sell foreign currency will generally be expected to limit any potential gain that might be realized by the strategies if the value of the hedged currency increases. In addition, although the strategies seek to minimize the impact of currency fluctuations on returns, the use of currency hedging will not necessarily eliminate exposure to all currency fluctuations. Hedging against a decline in the value of a currency does not eliminate fluctuations in the value of a security traded in that currency or prevent a loss if the value of the security declines. Moreover, it may not be possible for the strategies to hedge against a devaluation that is so generally anticipated that Stringer Asset Management is not able to contract to sell the currency at a price above the devaluation level it anticipates.

**Risks Related to ADRs:** Stringer Asset Management’s strategies may invest in American Depository Receipts (“ADRs”), which are typically issued by a U.S. bank or trust company and represent ownership of underlying foreign securities. In addition to the risks presented in any investment, such as changes in value and changes in demand, there are several risks unique to ADRs that must be considered. For instance, while they will react to normal market fluctuations like regular stocks, ADRs are still vulnerable to currency risks. If the value of the company’s home currency falls too much relative to the U.S. Dollar, the effect will trickle down to the ADR eventually. The same can be said for changes in the home country’s government.

**Risks Related to REITs:** Stringer Asset Management’s strategies may invest in real estate investment trusts (“REITs”). REITs’ share prices may decline because of adverse developments affecting the real estate industry, such as declining real estate values, changing economic conditions, and increasing interest rates. The returns from REITs may trail returns from the overall market. Additionally, there is always a risk that a given REIT will fail to qualify for favorable tax treatment or may not remain qualified as a REIT.

**Risks Related to MLPs:** Stringer Asset Management’s strategies may invest in Master Limited Partnerships (“MLPs”). Investing in MLPs includes risks, such as equity and commodity-like volatility. Also, distribution payouts sometimes include the return of principal and, in these instances, references to these payouts as “dividends” or “yields” may be inaccurate and may overstate the profitability/success of the MLP. Additionally, there are potentially complex and adverse tax consequences associated with investing in MLPs. This is largely dependent on how the MLPs are structured and the vehicle used to invest in the MLPs. It is strongly recommended that an investor consider and understand these characteristics of MLPs and consult with a financial and tax professional prior to investment.

**Risks Related to Commodities:** Stringer Asset Management’s strategies may invest in commodities, which allows for a source of diversification for those sophisticated persons who wish to add this asset class to their portfolios and who are prepared to assume the risks inherent in the commodities market. Any commodity purchase represents a transaction in a non-income-producing asset and is highly speculative.
Principal Risks (continued):

*Risks Related to Fixed Income*: Stringer Asset Management’s strategies that utilize debt securities are subject to the risk that changes in interest rates could affect the value of a client’s investment. Rising interest rates tend to cause the prices of debt securities (especially those with longer maturities) to fall. Rising interest rates may also cause issuers to pay off mortgage-backed and asset-backed securities later than anticipated, forcing the strategies to keep their money invested at lower rates. Falling interest rates, however, generally cause investors to pay off mortgage-backed and asset-backed securities earlier than expected, forcing the strategies to reinvest the money at a lower interest rate. The concept of duration is useful in assessing the sensitivity of fixed income strategies to interest rate movements, which are the main source of risk for most fixed income securities. Duration measures price volatility by estimating the change in price of a debt security for a 1% change in its yield. For example, a duration of five years means the price of a debt security will change about 5% for every 1% change in its yield. Thus, the higher the duration, the more volatile the security. Debt securities have a stated maturity date when the issuer must repay the principal amount of the bond. Some debt securities, known as callable bonds, may repay the principal earlier than the stated maturity date. Debt securities are most likely to be called when interest rates are falling because the issuer can refinance at a lower rate. The credit rating or financial condition of an issuer may affect the value of a debt security. Generally, the lower the quality rating of a security, the greater the risk that the issuer will fail to pay interest fully and return principal in a timely manner. The issuer of an investment-grade security is more likely to pay interest and repay principal than an issuer of a lower rated bond. Credit ratings are not an absolute standard of quality, but rather general indicators that reflect only the view of the originating rating agencies from which an explanation of the significance of such ratings may be obtained. If an issuer defaults or becomes unable to honor its financial obligations, the security may lose some or all of its value. High yield or “junk” bonds are highly speculative securities that are usually issued by smaller, less credit worthy and/or highly leveraged (indebted) companies. Compared with investment-grade bonds, high yield bonds carry a greater degree of risk and are less likely to make payments of interest and principal. Market developments and the financial and business conditions of the corporation issuing these securities influences their price and liquidity more than changes in interest rates, when compared to investment-grade debt securities. Insufficient liquidity in the junk bond market may make it more difficult to dispose of junk bonds and may cause the portfolio to experience sudden and substantial price declines.
