Agenda

- ✓ Preliminary Performance
 - » Broad Outlook
 - » Investment Implications
 - » Recent Activity
 - » Current Portfolio Allocations
 - » The Cash Indicator

BROAD OUTLOOK

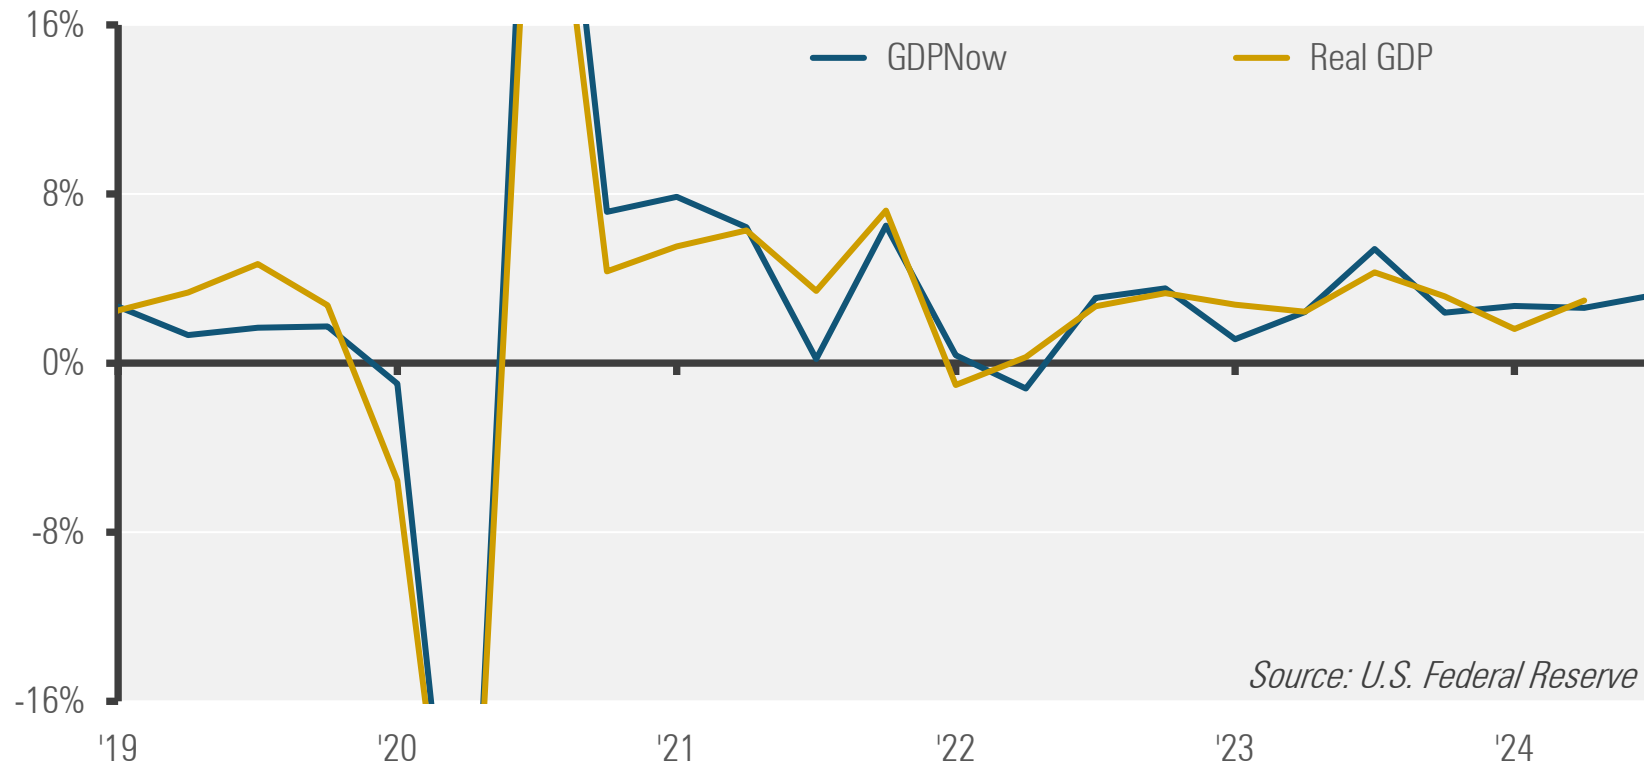

- » We have been focusing on what we are calling the *Great Normalization* as overall economic trends in the U.S. are getting back to normal.
- » The *Great Normalization* encompasses the gradual return to pre-pandemic economic norms despite significant structural changes and new challenges to navigate.
- » As we move forward, we expect a more measured economic environment with key indicators, such as GDP growth, jobs creation, and inflation, trending towards historical averages.
- » However, the normalization process is not without its challenges and disparities.
- » Global manufacturing sector continues to face headwinds with contractions in output, new orders, and employment.
- » Geographically, economic performance varies significantly, and this uneven recovery underscores the complex nature of the global economic landscape.
- » While challenges remain, particularly in addressing sectoral and geographic disparities, the overall trajectory suggests a move towards a more stable and predictable economic environment.
- » We are finding a substantial number of attractive investment opportunities in high quality U.S. equities and fixed income, as well as foreign companies that pay consistent dividends.
- » This changing environment is a focus of our *Three Layers of Risk Management* process as we continue to manage risk in real time.

BROAD OUTLOOK				
	U.S.	Europe	Japan	Emerging Markets
Monetary Conditions	Restrictive	Restrictive	Supportive	Expansionary
Fiscal Conditions	Expansionary	Supportive	Expansionary	Mixed
Leading Economic Indicators	Directionless	Softening	Softening	Strengthening
Equity Valuations	Mixed	Fairly Valued	Fairly Valued	Fairly Valued
Overall	Cautiously Optimistic	Cautiously Optimistic	Cautiously Optimistic	Cautiously Optimistic

SAMPLE OF RECENT ADDITIONS

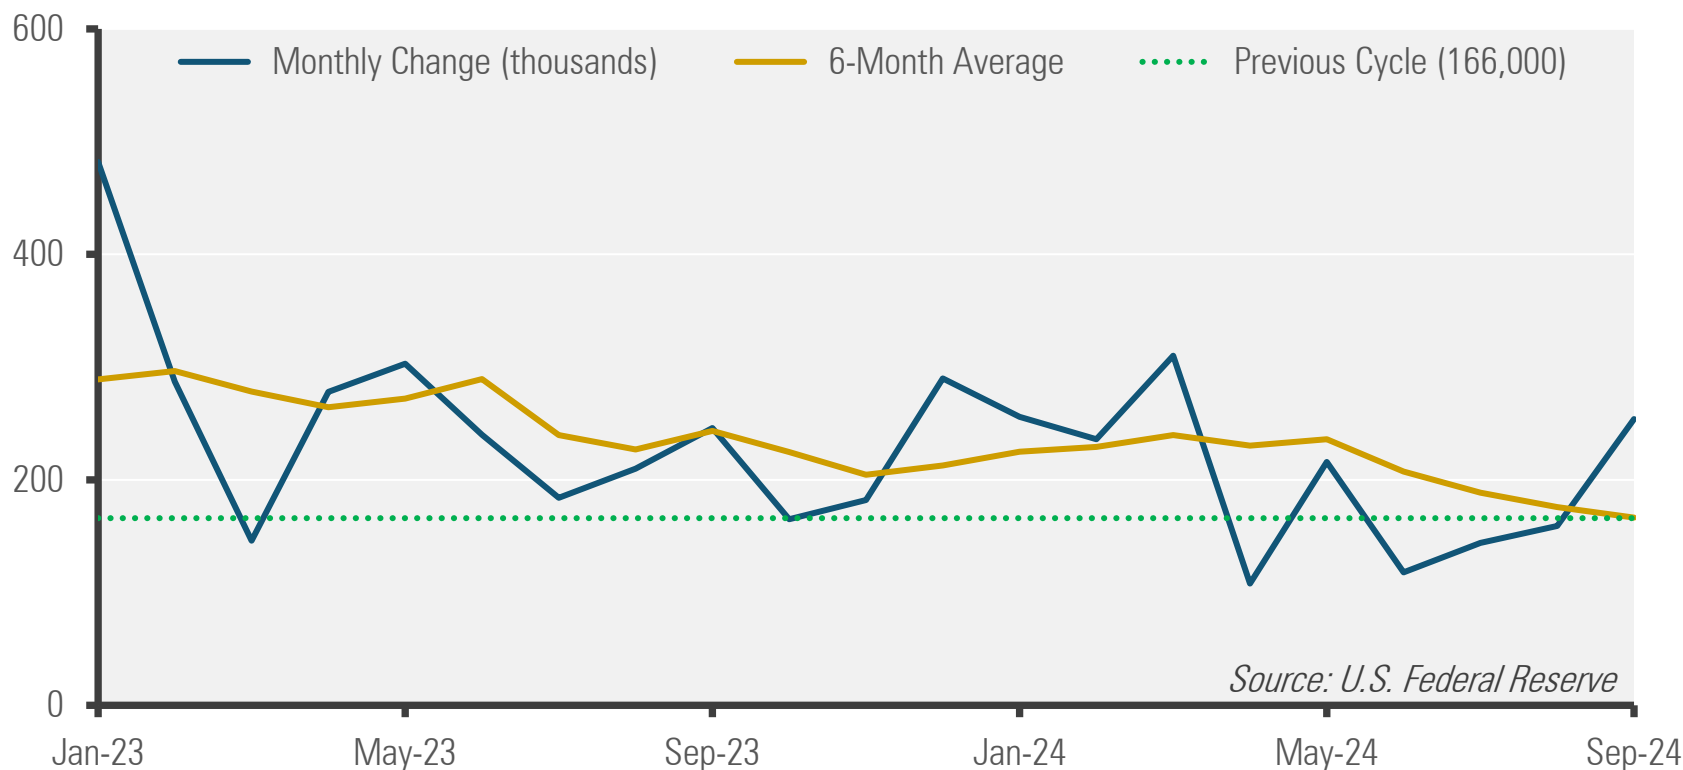

- » With the backdrop of persistent but slower economic growth, we continue to favor areas that have demonstrated consistent earnings growth over time as well as consistent dividends.
- » These investments offer both the potential for downside protection as well as gains due to their more durable business models.
- » Currently, our near-term outlook favors dividend strategies, while after a long period of complacency, market volatility also favors blue chip equity investments that utilize an equity option strategy to provide some downside protection.
- » As a result of the recent volatility, we took the opportunity to lean into more quality dividend exposure while also adding blue-chip equity that offers downside protection.
- » Additionally, we also purchased an insurance industry ETF while also increasing our exposure to broader global ETFs with a quality earnings focus.
- » The insurance industry has shown resilience and steady cash flows due to the essential nature of its offerings, which bodes well for our clients.

GDPNow & Real GDP

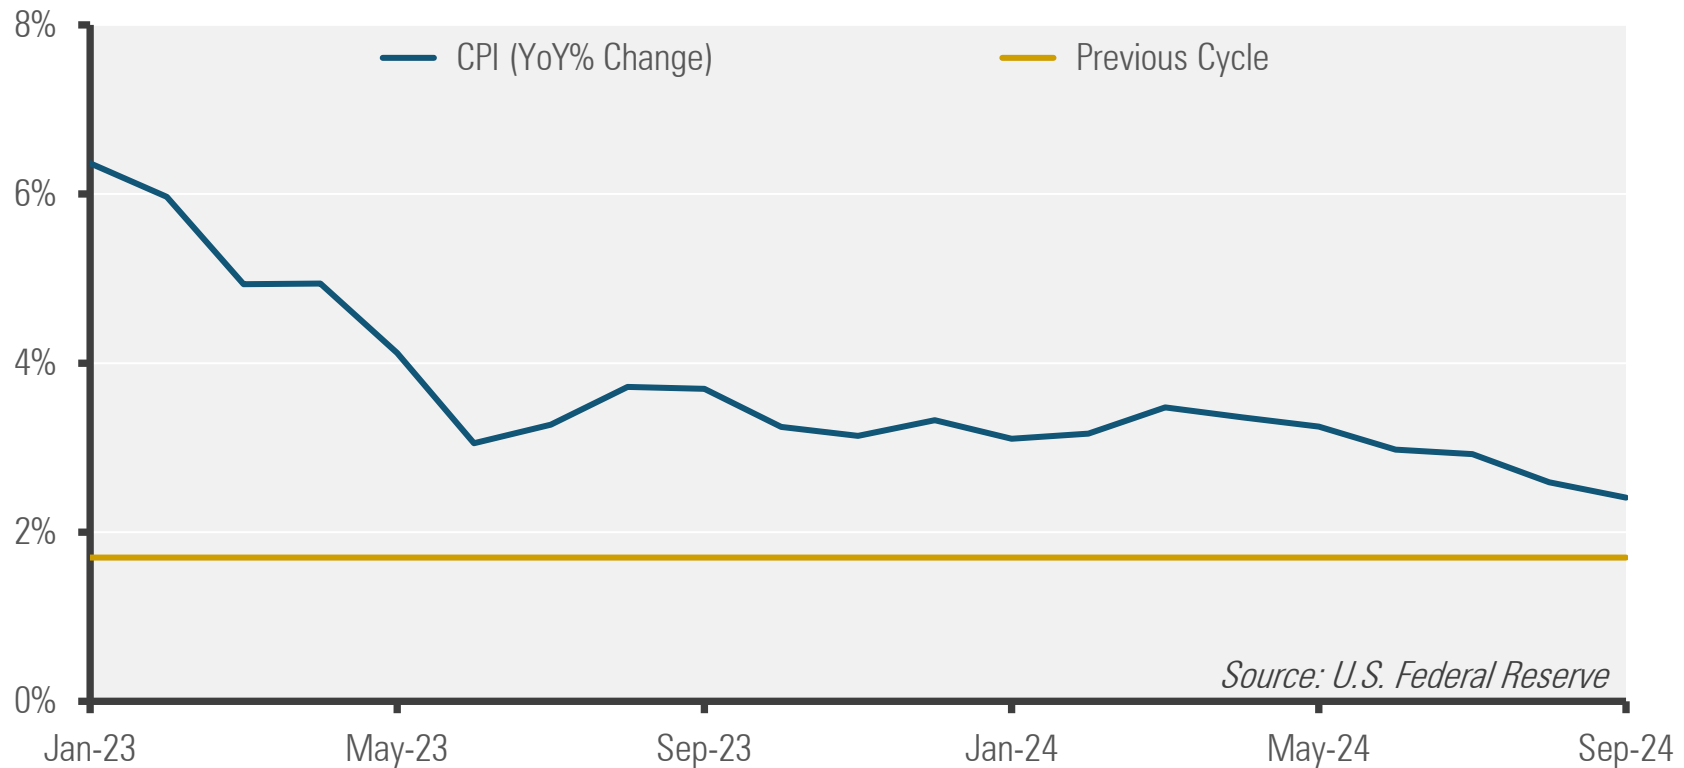

- » We can see economic growth trending towards a more normal rate through both the Federal Reserve Bank of Atlanta's GDPNow, which attempts to measure economic growth in real time, as well as the official GDP numbers that are published with a lag.
- » As the graph above shows, following the steep drop and dramatic recovery, measures of broad economic activity have been stabilizing around a healthy rate of growth.

Monthly Jobs Creation

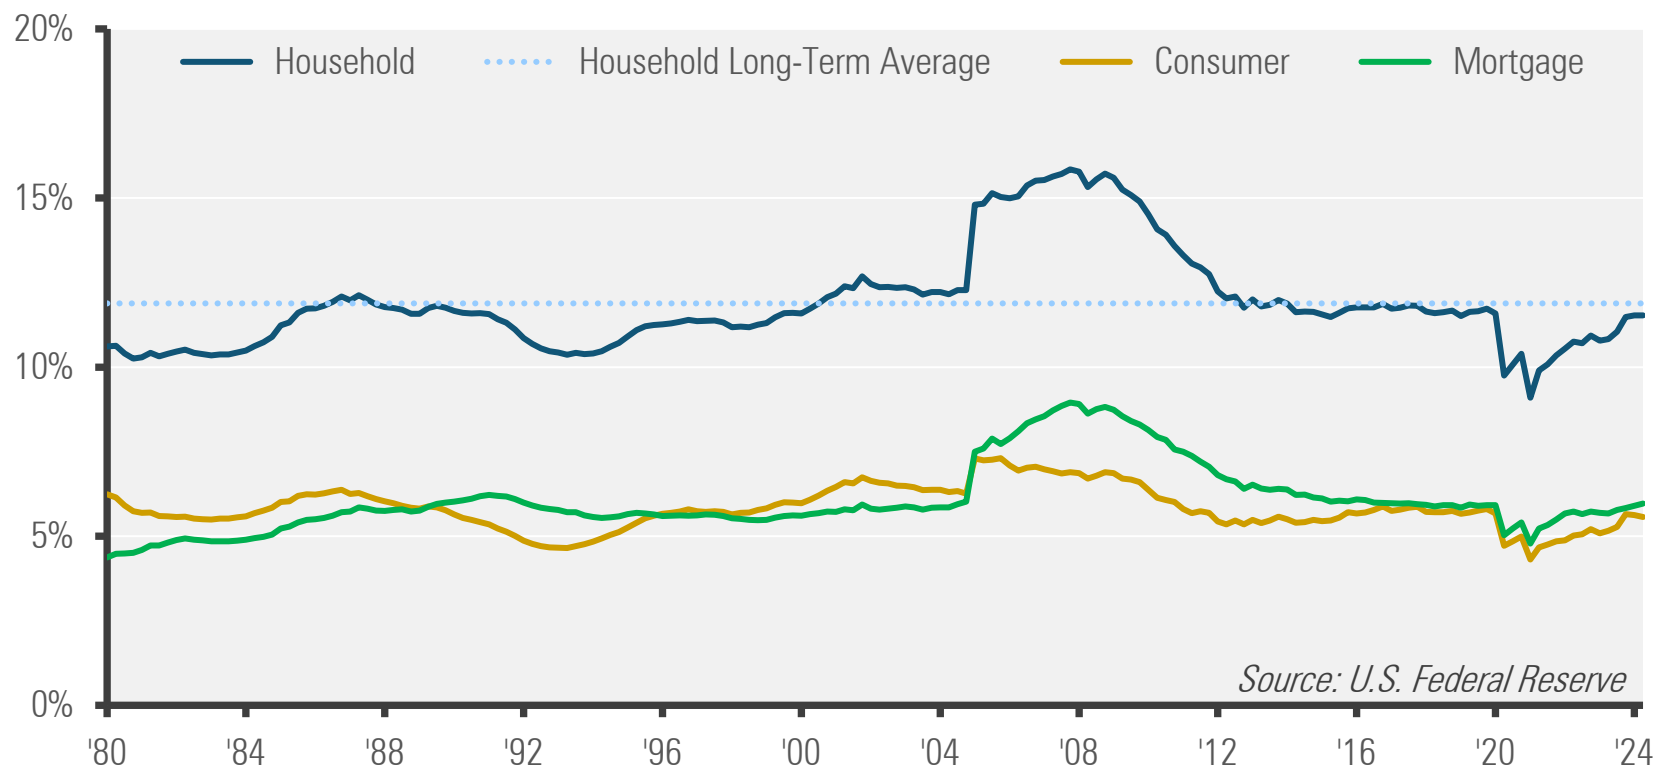

- » In addition to analyzing monthly employment reports, we track monthly jobs creation on a rolling 6-month average to smooth out the volatility around the monthly figures.
- » This graph shows jobs creation slowing recently and getting back to the approximately 166,000 new jobs per month average of the previous business cycle from July 2009 through February 2020.

Inflationary Pressures

- » Similarly, we are seeing inflationary pressure normalizing as well.
- » While the current business cycle average may end up being higher than the previous cycle's 1.7% due to the massive domestic industrial buildout in the United States, annual inflation of roughly 2.5%-3.0% that we expect would be consistent with longer-term U.S. history.

Debt Service (% of Disposable Income)

- » The private sector (businesses & households) is poised to take a leading role.
- » Personal income growth continues to outpace the rate of inflation while household debt levels are generally manageable, particularly outside the lowest income quintile.
- » Household debt service (the navy line: mortgage debt plus consumer debt) has increased recently towards the long-term average with the economy reopening.
- » Still, the current household debt ratio is well below the highs seen in the 2000s and leaves room for further economic expansion near historical rates.

INVESTMENT IMPLICATIONS

- » As this process unfolds, we are finding a substantial number of attractive investment opportunities in high quality U.S. equities and fixed income, as well as foreign companies that pay consistent dividends.
- » We believe that it will be essential for investors to remain adaptable and responsive to the evolving economic landscape.
- » This changing environment is a focus of our *Three Layers of Risk Management* process as we continue to manage risk in real time.

INVESTMENT OUTLOOK SUMMARY | FAVORED CHOICES

EQUITY	<i>U.S.</i> » equity income* , insurance* , technology* , quality value* <i>Global</i> » dividends, emerging markets x China* , quality
FIXED INCOME	short-duration commercial mortgage-backed securities and Treasuries* , defined-maturity core fixed income, taxable munis*
ALTERNATIVES	equity option overlay strategies

The Cash Indicator

Source: Bloomberg and Stringer Asset Management

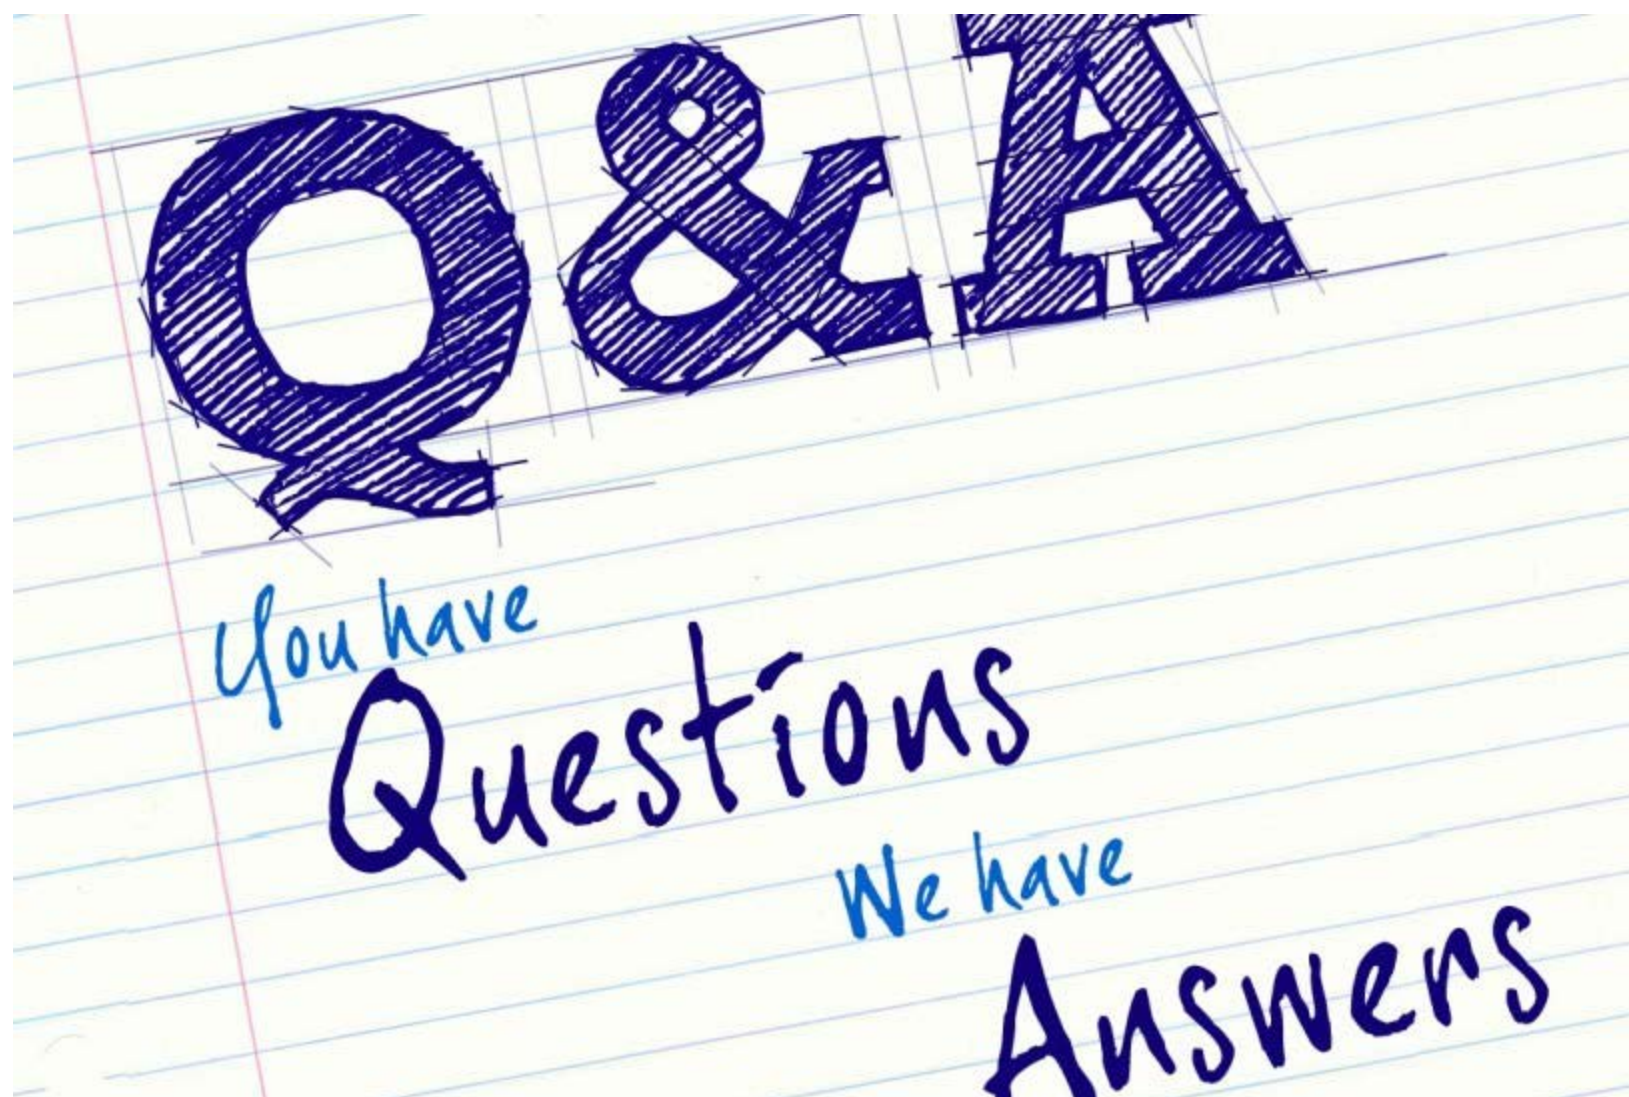

- » The Cash Indicator (CI) level has increased recently but remains below historical norms.
- » The increase reflects an uptick in equity market volatility that has gone from well below historical averages to moving back in line with typical equity markets.
- » Holding the CI below historical norms are persistently tight credit spreads, which suggests the bond market may be overly complacent.
- » Still, with a positive economic back drop, we view downside volatility as a buying opportunity.

Performance:

Stringer Asset Management LLC is a registered investment adviser that generally provides services through model portfolios on a sub-advisory business. The firm primarily allocates client's investment management assets among exchange-traded funds ("ETFs") and secondarily among mutual funds. A fully compliant GIPS presentation along with a complete list and description of all composites is available at www.stringeram.com or by calling 901-800-2956. Stringer Asset Management LLC claims compliance with the Global Investment Performance Standards (GIPS®).

Past performance is not indicative of future results. The investment return and principal value of an investment will fluctuate so that an investor's shares when redeemed may be worth more or less than their original cost. Current performance may be higher or lower than the performance data quoted. Advisory fees and any other expenses incurred in the management of the account will reduce actual returns. The performance of any individual portfolio may not be considered comparable to the Composite performance.

The Growth Composite includes all portfolios that mainly invest in equity and alternative ETFs selected from the global investment opportunity set. The Growth Composite has risk characteristics similar to that of the broad equity market and include but are not limited to equity risk, international investing risk and capitalization risk. The total returns presented are gross and net of fees. Advisory fees and any other expenses incurred in the management of the account will reduce actual returns. The benchmark is the MSCI ACWI Index rebalanced quarterly as of January 1, 2016. The benchmark is market-cap weighted and is composed of several country-specific indices. Sources of foreign exchange rates may be different between the composite and the benchmark; however, there have not been material differences to date. Prior to January 1, 2016, the benchmark was the MSCI World Index rebalanced quarterly. Prior to January 1, 2015, the blended benchmark was 70% Russell 3000 Index and 30% MSCI ACWI xUS Index rebalanced quarterly. In both cases, the benchmark was retroactively changed to more closely follow our investment strategy. The index represented does not bear transaction costs or management fees, and cannot be actually bought or sold. It is not possible to invest directly in an index. For index definitions, see the Index Definitions section at the end of this document. The U.S. Dollar is the currency used to express performance. Material use of leverage, derivatives and short positions are not used in this composite.

The Moderate Growth Composite includes all portfolios that mainly invest the majority of their assets in equity exchange-traded funds but also includes fixed income and alternative ETFs selected from the global investment opportunity set. The Moderate Growth Composite has risk characteristics lower than that of the broad equity market and include but are not limited to equity risk, international investing risk and credit risk. The total returns presented are gross and net of fees. Advisory fees and any other expenses incurred in the management of the account will reduce actual returns. The benchmark is a blend of 65% MSCI ACWI Index and 35% Barclays U.S. Aggregate Bond Index rebalanced quarterly as of January 1, 2016. The benchmark is market-cap weighted and is composed of several country-specific indices. Sources of foreign exchange rates may be different between the composite and the benchmark; however, there have not been material differences to date. Prior to January 1, 2016, the blended benchmark was 65% MSCI World Index and 35% Barclays U.S. Aggregate Bond Index rebalanced quarterly. Prior to January 1, 2015, the blended benchmark was 45% Russell 3000 Index, 20% MSCI ACWI xUS Index and 35% Barclays U.S. Aggregate Bond Index rebalanced quarterly. In both cases, the benchmark was retroactively changed to more closely follow our investment strategy. The index represented does not bear transaction costs or management fees, and cannot be actually bought or sold. It is not possible to invest directly in an index. For index definitions, see the Index Definitions section at the end of this document. The U.S. Dollar is the currency used to express performance. Material use of leverage, derivatives and short positions are not used in this composite.

Disclosures

Index Definitions:

Bloomberg Barclays U.S. Aggregate Bond Index – This Index provides a measure of the U.S. investment grade bond market, which includes investment grade U.S. Government bonds, investment grade corporate bonds, mortgage pass-through securities and asset-backed securities that are publicly offered for sale in the United States. The securities in the Index must have at least 1 year remaining to maturity. In addition, the securities must be denominated in US dollars and must be fixed rate, nonconvertible and taxable.

MSCI ACWI (Net) Index – This Index is a free float-adjusted market capitalization weighted index that is designed to measure the equity market performance of developed and emerging markets. The MSCI ACWI Index consists of 23 developed and 23 emerging market country indexes. Net total return includes the reinvestment of dividends after the deduction of withholding taxes, using a tax rate applicable to non-resident institutional investors who do not benefit from double taxation treaties.

S&P 500 Index – This Index is a capitalization-weighted index of 500 stocks. The Index is designed to measure performance of a broad domestic economy through changes in the aggregate market value of 500 stocks representing all major industries.

S&P 500 Dividend Aristocrats Index – This Index tracks companies within the S&P 500 Index that have a record of raising their dividends for at least 25 consecutive years. Each company is equally weighted within the Index. S&P will remove companies from the Index when they fail to increase dividend payments from the previous year. The Index's universe includes stocks with a float-adjusted market capitalization of at least \$3 billion and an average daily trading volume of at least \$5 million, in addition to consistently increasing dividend payments. The index requires a minimum of 40 companies.

Disclosures

Statistical Definitions:

Standard deviation – A statistical measure of volatility, standard deviation is often used as an indicator of the ‘risk’ associated with a return series. Standard deviation of return measures the average deviations of a return series from its mean. A large standard deviation implies that there have been large swings in the return series of the manager.

Alpha – Alpha is a measure of risk (beta)-adjusted return. Alpha measures the difference between a portfolio’s actual returns and what it might be expected to deliver based on its level of risk. In an ideal sense, higher risk should equate to higher return. A positive alpha means the fund has beaten expectations. A negative alpha means that the fund has failed to match performance given its level of risk. If two managers have the same return, but one has a lower beta, that manager would have a higher alpha.

Beta – This represents the systematic risk of a portfolio and measures its sensitivity to a benchmark. A portfolio with a beta of one is considered to be as risky as the benchmark and would therefore provide expected returns equal to those of the market benchmark during both up and down periods. A portfolio with a beta of two would move approximately twice as much as the benchmark.

Yield – Portfolio and benchmark yields are calculated using a harmonic weighted average of the net dividends per share during the past 12 months for each holding as of the date identified at their respective target weighting.

Disclosures

Principal Risks:

Allocation risk – The performance of the portfolio relative to its benchmark will depend largely on the decisions to strategic asset allocation and tactical adjustments made to the asset allocation. At times, judgments as to the asset classes in which the portfolio should invest may prove to be wrong, as some asset classes may perform worse than others or the equity markets generally from time to time or for extended periods of time. *Market risk* – The value of securities in the portfolio may decline due to daily fluctuations in the securities markets, including fluctuation in interest rates, national and international economic conditions and general equity market conditions. *Management style risk* – To the extent the portfolio focuses on a particular style of stocks, such as growth or value, its performance may at times be better or worse than that of similar portfolios with other focuses or that have a broader investment style. *Business and sector risk* – From time to time, a particular set of circumstances may affect a particular industry or certain companies within an industry, while having little or no impact on other industries or other companies within the industry. *Large company risk* – The portfolio may invest in larger, more established companies, which may be unable to respond quickly to new competitive challenges such as changes in consumer tastes or innovative smaller competitors. Also, large companies are sometimes unable to attain the high growth rates of successful, smaller companies, especially during extended periods of economic expansions. *Mid-sized company risk* – The portfolio may invest in mid-cap companies, which may be more vulnerable to adverse business or economic events than larger, more established companies. In particular, these mid-sized companies may pose additional risks, including liquidity risk, because these companies tend to have limited product lines, markets and financial resources, and may depend upon a relatively small management group. *Small company risk* – The portfolio may invest in smaller companies, which generally have less experienced management teams, serve smaller markets, and find it more difficult to obtain financing for growth or potential development than larger companies. *Real Estate Investment Trust ("REIT") risk* – The portfolio may invest in ETFs or other pooled investment vehicles that invest in REITs. REITs are susceptible to the risks associated with investing in real estate generally, including, among others, declines in the value of real estate, lack of ability to access the credit markets and defaults by borrowers or tenants. *Commodities risk* – The portfolio may invest in ETFs or other pooled investment vehicles that invest in commodities, such as raw materials or agricultural products. Commodities are tied to future market values and future income and are vulnerable to adverse movements in prices and exchange rates. Additionally, the price of commodities may be affected by geopolitical changes and relations. *Credit risk* – An issuer of debt securities may not make timely payments of principal and interest. *Debt securities risk* – Increases in interest rates typically lower the value of debt securities held by the portfolio. Investments in debt securities include credit risk. There is also the risk that a bond issuer may "call," or repay its high yielding bonds before their maturity dates. Debt securities subject to prepayment can offer less potential for gains during a declining interest rate environment and similar or greater potential for loss in a rising interest rate environment. Limited trading opportunities for certain debt securities may make it more difficult to sell or buy a security at a favorable price or time. *High yield securities risk* – Investments in high yield fixed income securities, also known as "junk bonds", involve a greater risk of default and are subject to a substantially higher degree of credit risk or price fluctuations than other types of debt securities. *Interest rate risk* – Increases in interest rates typically lower the present value of a company's future earnings stream. Accordingly, stock prices will generally decline when investors anticipate or experience rising interest rates. *Issuer risk* – The value of an individual security or particular type of security can be more volatile and thus perform differently than the market as a whole. *Shares of other investment companies and ETFs risk* – Investors will indirectly bear fees and expenses charged by the underlying funds in which the portfolio may invest in addition to the portfolio's direct fees and expenses and, as a result, the cost of investing in the portfolio will generally be higher than the cost of investing directly in the underlying fund shares. Investments in ETFs bear the risk that the market price of the ETF's shares may trade at a discount to their net asset value or that an active trading market for an ETF's shares may not develop or be maintained. *Non-diversified fund risk* – A non-diversified fund is generally subject to the risk that a large loss in an individual issue will cause a greater loss for the fund than it would if the fund was required to hold a larger number of securities or smaller positions. *Foreign exposure risk* – Foreign markets, particularly emerging markets, can be more volatile than the U.S. market due to increased risks of adverse issuer, political, regulatory, or economic developments. *Foreign currency risk* – The value of an investment denominated in a foreign currency will decline in dollar terms if that currency weakens against the dollar. Additionally, certain countries may utilize formal or informal currency-exchange controls or "capital controls." Such controls may also affect the value of the portfolio's holdings. *U.S. Government and U.S. agency obligations risk* – There can be no assurance that the U.S. Government would provide financial support to its agencies or instrumentalities (including government-sponsored enterprises) that issue or guarantee certain securities where it is not obligated to do so.
